General Information

Background

Intronless gene is a member of the frizzled gene family. Members of this family encode seven-transmembrane domain proteins that are receptors for the Wingless type MMTV integration site family of signaling proteins. Most frizzled receptors are coupled to the beta-catenin canonical signaling pathway. This gene is highly expressed in two human cancer cell lines, indicating that it may play a role in several types of cancer.

Immunogen

Polyclonal antibody is produced by immunizing animals with a synthetic peptide of Frizzled 8.

Purification

Polyclonal antibody was purified by immunogen affinity chromatography.
