General Information

Background	TrkA is the high affinity catalytic receptor for the neurotrophin, Nerve Growth Factor, or "NGF". As such, it mediates the multiple effects of NGF, which include neuronal differentiation and avoidance of programmed cell death. TrkA was originally cloned from a colon tumor; the cancer occurred via a translocation, which resulted in the activation of the TrkA kinase domain. However, TrkA itself does not appear to be an oncogene. Phosphorylation at Y757 site reflects TrkA kinase activity.
Immunogen	Polyclonal antibody is produced by immunizing animals with a synthetic peptide of p-TrkA (Y757).
Purification	Polyclonal antibody was purified by Protein A affinity chromatography.
