## **General Information**

Protein kinase C (PKC) is a family of serine- and threonine-specific protein **Background** 

> kinases that can be activated by calcium and the second messenger diacylglycerol. PKC family members phosphorylate a wide variety of protein targets and are known to be involved in diverse cellular signaling pathways. Diacylglycerols (DAG) and tumor-promoting phorbol esters bind to and activate PKC. PKCα has been reported to play roles in many different cellular processes, such as cell adhesion, cell transformation, cell cycle checkpoint, and cell volume control. Knockout studies in mice suggest that this kinase may be a fundamental regulator of cardiac

contractility and Ca(2+) handling in myocytes.

**Immunogen** Polyclonal antibody is produced by immunizing animals with a synthetic

peptide of PKC α.

**Purification** Polyclonal antibody was purified by immunogen affinity chromatography.
