General Information

Background TLR7 is a member of the Toll-like receptor (TLR) family which plays a fundamental role in pathogen recognition and activation of innate immunity. The TLR family members are characterized by a highly conserved Toll homology (TH) domain, which is essential for Toll-induced signal transductions. They recognize pathogen-associated molecular patterns (PAMPs) that are expressed on infectious agents, and mediate the production of cytokines necessary for the development of effective immunity.

Immunogen Polyclonal antibody is produced by immunizing animals with a synthetic peptide of TLR7.

Purification Polyclonal antibody was purified by Protein A affinity chromatography.
